John, See the request below. - Dave

>>> James Prairie 4/3/2006 9:35:18 AM >>>

Dave,

If NM is going to continue to provide BOR their CUL numbers can I request that they provide there numbers monthly, at least at an 8-digit Hydrologic Unit Code (HUC) spatial level, if at all possible?

This is the current temporal and spatial scale used in the natural flow model and would greatly help in our efforts to collect data and compute natural flow.

Also, if NM could provide their estimates annually this would help us with our provisional estimates for natural flow. The last values for Irrigated Ag CU we received from NM were from 1996-2000. Since this time we have been extrapolating the data from the 1996-2000 period. This has prevented us from accurately representing the resent drought for NM irrigated agriculture CU.

Jim

I just got off the phone with the Engineering Committee of the UCRC and they support changing the CUL record to use the SCS method for Effective Precip for the entire record. Brenda, I understand you are feverishly reworking the 1970's irrigation uses. John Whipple reports that it will have probably make about +1maf cumulative difference between 1970-77... and a bit more for the remainder of the decade. JW is reworking the NM depletion tables. The NM table will now match the BO table (close enough) to show 270k use for NIIP (no more following presumption). NM will be using m-BC method for CUL in the future. Jim, I understand you are working on fixing the Navajo Evap problem (the Eng Committee agreed it needs to be fixed). Tom Ryan would like Brenda's rework to get into the natural flows asap so that the work on the CR shortage EIS uses the same base as the HydroDetermination. If not in the next month or two, the by Sept..ish. We can talk.

All in all this whole effort is putting major grins on our regional director's and Area Manager's faces.

John,

Brenda Kinkel did a comparison of CUL using 1981-2004 data that was readily available and found that the BOR effective precip method averages 508kaf/yr less use in the UC Basin than the SCS method we've commonly used. Furthermore, based on some research and hand checks, Brenda concludes that the 1971-80 period probably used the BOR method. The remainder of the record (1906-70 per John Redlinger memo and 1981-2004) uses the SCS method.

What this suggests to me is that the natural flow database might be underestimated during the 1971-77 critical period... by about 500k af/yr, assuming we all agree to use the SCS method for effective precip for both the natural flow database and CUL. During droughts like 2002, this number may drop to 400kaf/yr, but still a fairly large amount of water.

Now obviously the ideal situation would be to have all the record consistent for the Natural Flow and Future Depletion schedule. I've asked Brenda to work on entering the data and recomputing the 1971-80 record but that will be from scratch and will not likely be done until the end of the summer. It will then have to be computed into the natural flow database.

I suppose we might consider bumping the natural flow up by say 400kaf/yr during 1971-80 for the HD. Not having the analysis, I'd prefer to wait on declaring this water is truly available... but it should weigh into any discussions.

Regards - Dave
